1.1 Purpose

During their university studies, in order to start entering the workforce, a student might decide to apply for an internship related to their field of study. Similarly, companies offering internships may be interested in finding students that are adequate for them. To facilitate the matching between students and companies, a new platform called *Students and Companies* (S&C) is to be developed. S&C allows companies to look for suitable students by publish internship advice on the platform, while students can look for internships that interest them. Moreover, the platform implements recommendation mechanism to help student and companies to find each other. Once the contact is established, S&C can provide support to the students selection process.

1.1.1 Goals

The main goals of the system are:

- [G1] students and companies establish contacts for doing internships;
- [G2] internships selections can be monitored and supported by the system;
- [G3] ongoing internships can be monitored from the system.

1.2 Scope

In this section, we are identifying the S&C domain. In particular, there are two main users categories that interact with the system: *Companies* and *Students*. The companies publish announcements about the internships they want to offer where they specify *projects* that will be carried out and the *terms* of the offer. The system itself informs the companies about the availability of students who may be suitable for their internships (based on their profile).

Students, on the other hand, may use the platform to look for internships and S&D can also notify them if there are new internships that could meet their interests, but they can still independently search through all the available internships.

[DA METTERE PARTE DELLA SELEZIONE] Once a *contact* is established, the student selection process begins and once completed, the system collects feedback and suggestions from both students and companies. Finally, both students and companies can monitor the progress of the internships by providing information on its development and any issues that may arise.

Machine-controlled Shared Phenomena

1 Introduction

1.3 Definitions, Acronyms and Abbreviations

1.3.1 Definitions

1.3.2 Acronyms

- ► S&C: Students&Companies, the name of the platform;
- ▶ UML: Unified Modeling Language.

1.3.3 Abbreviations

- ► G_n: Goal number n;
- ► R_n: Requirement number n;
- ▶ D_n: Domain assumption number n;
- ► WP_n: World Phenomena number n;
- ► SP_n: Shared Phenomena number n;
- ► CV: Curriculum Vitae;
- ▶ UC: Use Case.

1.4 Revision history

1.5 Reference documents

The Documents used to deliver the RASD document are the following:

- ▶ the Specification of RASD and DD assignment of Software Engineering 2;
- ▶ the class slides on WeBeep, in particular slides on RE (requirement engineering), scenarios and Use Cases and UML diagrams;

1.6 Document structure

1. **INTRODUCTION**: in this section, we provide a brief introduction to the purpose of the platform to be developed, S&C in this case, focusing in particular on the most important goals which we aim to achieve and on the various phenomena identified;

2.1 Product perspective

2.1.1 Scenarios

Student signs up to S&C

Student Bob enters in the system for the first time. On the homepage, he first clicks the *Registration button* and then the *Student Registration button*. To register, Bob fills out a form providing its institutional e-mail (bob.johnson@mail.polimi.it) and password (which will be used for future logins), a brief description of his academic background and specifies whether he would like to receive notifications from the system about future published internships. Finally, Bob uploads his CV by clicking the *Upload CV button*. Now Bob is registered and can search for internships that interest him.

Company signs up to S&C

The company FinestraMI enters the system for the first time. On the homepage, it first clicks the *Registration button* and then the *Company Registration button*. To register, the company fills out a form providing its name, a brief description of its area of expertise and its business area (the market where it operates) and finally its corporate e-mail (info@finestrami.it) and password (which will be used for future logins). FinestraMI also specifies, by selecting the appropriate option, whether it wants to be notified about the availability of students who may be of its interest. Now, FinestraMI is registered and can publish its internships advice.

Company publishes an internship offer

The company FinestraMI enters in the system; on the homepage, it clicks the *Login button*. Once logged in, FinestraMI accesses the *Publish New Internship section*. A new internship advice is added by filling out a form where the following information is provided:

- ► "Window restore" (the intership title);
- ► "The aim of this internship is to give to student to opportunity to repair office windows and..." (a brief description);
- ▶ "third year bachelor students..." (experience required);
- ▶ "not suffering from dizziness" (desired skills);
- ▶ "1. coordination of glass disposal; 2. ..." (main activities the internship involves);
- ▶ "no paid, canteen tickets available" (terms of the internship);
- ► "" (advice deadline).

Now the internship advice is visible to students registered on the platform (and also to FinestraMI).

Student proactively searches for an internship

Students Bob, Alice and Micheal access to the system by clicking "Login". Each one of them wants to find an internship to apply but each one of them has a different idea of what and where he/she would like to do/be:

▶ Bob is really interested on doing practice on an handwork but he neither knows a name of a company nor knows which kind of handwork apply for so, he goes to the *View Internships section*, where he can see all the published internships, listed from the most recent to the least recent. The most recent one is "Window restore" by FinestraMI, then he selects it;

- ▶ Alice has not already decided the kind of internship she wants to apply for but knows many names of companies that operate near her home and so she prefers to go to the *View Companies section*, where she can see all the registered companies and all the internships published by each company. Then she recognized FinestraMI and since she knows that it is expanding, she decides to select it. "Window restore" is the only available advice of FinestraMI but she select it anyways;
- ▶ Micheal is looking forward to do an internship related to windows restoration, so he uses the search bar to insert "windows restoration" and selects the option "only paid internships", but no internship are found. Then he removes the option and find the internship of FinestraMI. Since it is the only left, he selects it.

Student receive a notification about a new internship

The company CancellaMI (previously registered to the platform) publishes a new internship related to railings maintenance then, Student Bob, who has chosen to be notified by the system when new internships that might be of interest are published, receives an email informing it that a new intership related to his studies is available, since it stated in his CV that after the internship at FinestraMI he became passionate of railings. Bob then logs into the platform and, by going to the *Notification section*, can view the internships offer in more detail.

Company receives a notification about new possibly interested students

Company FinestraMI, which has chosen to be notified by the system, receives an email informing it that new students are appealing for its intership "Window Restore" (based on their CVs). FinestraMI then logs into the platform, goes into the *Internship section*, clicks on *Windows restore internship* and by going to the *Notification section* can view the students' profiles and their CVs in more detail.

Student applies for an internship

Student Bob wants to apply for the internship "Windows restore". To do so, they log into the system, access the page for "Windows restore" internship and click the *Apply button*. Automatically, the system will send a notification to FinestraMI (the company offering the internship) to inform it that Bob has applied

The company accepts the application of a student

Company FinestraMI receives the email regarding student Bob's application for the internship "Window Restore". FinestraMI then logs into the platform, navigates to the *Internships section*, select the *Window Restore Internship*, goes to the *Notification section* and clicks the *Accept Application button* to approve Bob's application.

The application deadline expires and the selection process is configured

The administrator of the company FinestraMI notices that the application deadline for the internship advice "Window Restore" (which was previously published on the platform) is now expired and selection process for that internship has not configured yet, so he goes to the designated page and configures:

- ▶ two steps (the selection process will be made up of two steps);
- ▶ a set of metrics to evaluate students ("manual skills" and "knowledge of materials" in this case);
- ▶ each step is configured as a questionnaire with a series of questions for the students, in this case in particular:
 - 1. first step is test of both open and closed questions regarding knowledge of materials. For closed questions, the platform is also able to automatically check if they are corrected or not (and so, for each closed question, also the scores to assign to each possible answer are inserted into the system). Open questions will be evaluated manually by the company;

- 2. second step is an oral exam. Since there are no predefined questions for this step, the company only inserts into the system one open question called "oral exam", scores will be inserted by the company at the end of the exam.
- ▶ for each step and for each candidate, the company chooses also the date in which it provides the questionnaire to the candidate.

The selection process runs

For the internship advice "Window restore", the company FinestraMI received three applications: Bob, Alice and Micheal. FinestraMI is planning to accept only one student at time, therefore it chooses to first call Micheal for the first step, since his curriculum impressed more the company. On Micheal is called and the questionnaire is given to him. His answers are evaluated (automatically for the closed ones and manually for the opened ones) and gets an overall score of 99 out of 100: the company decides to select him, discards Bob's application and leaves suspended the call for Alice. The company sets for Bob and Micheal the right message and the platform notifies them.

A student reports a complaint on one of the internship is currently doing

Today, Alice who is currently enrolled in the internships at the company WeWorkGreat had a problem with the task that was given to her, she asks the helpdesk of the company where she is performing the internship and they ask her to upload a video on the company file sharing platform to show the situation. Alice notices that she can't upload the video because the maximum uploading size for students is to 10 MB, then she opens Students&Companies and writes a compliant that states that the file sharing system of WeWorkGreat is only of 10 MB.

Table 3.1: Requirements mapping for goal G1

[G1] students and companies establish contacts for doing internships

[R10101] the system allows students to sign up to the platform with their institutional mails [R10102] the system allows a student to set up whether he/she wants to be notified of the presence of internship advice that might interest him/her

[R10103] the system allows students upload their CV to the platform

[R10104] the system allows students to publish on their profile a brief description of themselves [R10201] the system allows companies to sign up to the platform with their company address [R10202] the system allows companies to insert the main information regarding their business area and area of expertise

[R10203] the system allows a company to set up whether it wants to be notified of the presence of students that might be interested to its internship advice

[R10301] the system allows companies to publish internship advice where they specify the main information regarding the internship (brief description, experience required, desired skills, main activities involved and the terms) and the submission deadline

[R10401] the system allows students to search internships advice by name (and also to see the complete list of available advice). The system shall act as a search engine to present also the names of the advice that are similar to the searched one [R10402] the system allows students to search companies by name (and also to see the complete list of registered companies) and then access to their profile

[R10403] the system allows students to filter the results they searched (e.g. "only paid internships", "only companies located in Lombardy")
[R10501] when the system recognizes that a new internship advice that might interest a student (that allowed the notification option) is published it notifies that student by sending him an e-mail (to your address)

[R10601] when the system recognizes that a student has a profile that would fit an internship advice, the company that published the advice is notified [R10602] when a company opens a student profile, it can propose to him to apply for one of its internships

[R10701] the system allows students to apply for any internship advice which deadline has not expired

[R10702] when a student applies for an internship, the related company is notified by the system

[D10101] students upload their CV in Europass format

[D10102] information on a student CV do not contradict each other

[D10302] information companies insert in internship advice do not contradict each other

Table 3.2: Requirements mapping for goal G2

[G2] internships selections can be monitored and supported by the system

[R20101] when the deadline for an internship advice is expired, the system allows the company to set up the selection process by specifying for each step, the relative questionnaire (with metrics for each question) and the date in which provide it to a student (dates may differ between different students)

[R20201] the system automatically calculates the scores of questionnaire closed answers

[R20202] the system allows companies to manually insert scores for questionnaire open answers

[R20203] the system allows companies to visualize and compare selections scores

[R20204] in any selection phase, the system allows companies to discard a student currently involved in the selection process (discarded students are removed by the selection process)

[R20205] in any selection phase, the system allows companies to accept a student currently involved in the selection process (accepted students are removed by the selection process)

[R20206] the system allows companies to write a personalized message to communicate the result of a selection

Table 3.3: Requirements mapping for goal G3

[G3] ongoing internships can be monitored from the system

[R30101] the system allows students and companies to consult the internships (ongoing or finished)

[R30102] the system allows students and companies to report complaints on the internships they are involved in

3.3 Performance Requirements

- 3.4 Design Constraints
- 3.4.1 Standards compliance
- 3.4.2 Hardware limitations
- 3.4.3 Other constraints
- 3.5 Software System Attributes
- 3.5.1 Reliability
- 3.5.2 Availability
- 3.5.3 Security
- 3.5.4 Maintainability
- 3.5.5 Portability

4 Figures and Tables

4.1 Normal Figures and Tables

Figures and tables can be inserted just like in any standard LATEX document. The graphicx package is already loaded and configured in such a way that the figure width is equal to the textwidth and the height is adjusted in order to maintain the original aspect ratio. As you may have imagined, the captions will be positioned... well, in the margins. This is achieved with the help of the floatrow package.

Here is a picture of Mona Lisa (Figure 4.1), as an example. The captions are formatted as the margin- and the side-notes; If you want to change something about captions you can use the command \captsetup from the caption package. Remember that if you want to reference a figure, the label must come *after* the caption!

While the format of the caption is managed by caption, its position is handled by the floatrow package. Achieving this result has been quite hard, but now I am pretty satisfied. In two-side mode, the captions are printed in the correct margin.

Tables can be inserted just as easily as figures, as exemplified by the following code:

Listing 4.1::

```
\begin{table}
  \begin{tabular}{ c c c c }
     \toprule
     col1 & col2 & col3 & col 4 \\
     \mbox{multirow{3}{4em}{Multiple row} \& cell2 \& cell3 \& cell4\\ \&
     cell5 & cell6 & cell7 \\ &
     cell8 & cell9 & cell10 \\
8
     cell5 & cell6 & cell7 \\ &
10
      cell8 & cell9 & cell10 \\
11
      \bottomrule
12
  \end{tabular}
13
14 \end{table}
```

which results in the useless Table Table 4.1 on the following page.

The credits for the image above the chapter title go to: Bushra Feroz, CC BY-SA 4.0, https://commons.wikimedia.org/w/index.php?curid=68724647

Table 4.1: A useless table.

| col1 | col2 | col3 | col 4 |
|----------|-------|-------|--------|
| Multiple | cell2 | cell3 | cell4 |
| | cell5 | cell6 | cell7 |
| row | cell8 | cell9 | cell10 |
| Multiple | cell2 | cell3 | cell4 |
| | cell5 | cell6 | cell7 |
| row | cell8 | cell9 | cell10 |

I don't have much else to say, so I will just insert some blind text. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

Figure 4.1: It's Mona Lisa again. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

4.2 Margin Figures and Tables

Marginfigures can be inserted with the environment marginfigure. In this case, the whole picture is confined to the margin and the caption is below it. Figure ?? is obtained with something like this:

Listing 4.2::

1 \begin{marginfigure}

2 \includegraphics{monalisa}

3 \caption[The Mona Lisa]{The Mona Lisa.}

4 \labfig{marginmonalisa}

5 \end{marginfigure}

There is also the margintable environment, of which Table 4.2 is an example. Notice how you can place the caption above the table by just placing the \caption command before beginning the tabular environment. Usually, figure captions are below, while table captions are above. This rule is also respected for normal figures and tables: the captions are always on the side, but for figure they are aligned to the bottom, while for tables to the top.

Marginfigures and tables can be positioned with an optional offset command, like so:

```
\begin{marginfigure}[offset]
\includegraphics{seaside}
\end{marginfigure}
```

Offset ca be either a measure or a multiple of \baselineskip, much like with \sidenote, \marginnote and \margintoc. If you are wondering how I inserted this orange bubble, have a look at the todo package.

4.3 Wide Figures and Tables

With the environments figure* and table* you can insert figures which span the whole page width. For example, here are a wide figure and a wide table.

Figure 4.2: A wide seaside, and a wide caption. Credits: By Bushra Feroz, CC BY-SA 4.0, https://commons.wikimedia.org/w/index.php?curid=68724647

It is the user's responsibility to adjust the width of the table, if necessary, until it is aesthetically pleasing. The previous table was obtained with the following code:

                                     & Salary
                                                      & Age
                                                             & Height
                                                                        & Country \\
6
         \midrule
7
         Alice & Red
                          & Writer
                                     & 4.000 \pounds
                                                      & 34
                                                             & 167 cm
                                                                         & England \\
                          & Bartender & 2.000 \pounds
                                                      & 24
                                                                         & Scotland \\
8
         Bob
                & White
                                                             & 180 cm
                          & Scientist & 4.000 \pounds
                                                      & 26
                                                                         & Wales \\
9
         Drake & Green
                                                             & 175 cm
10
         \bottomrule
     \end{tabular}
12 \end{table*}
```

The float row package provides the 'H' specifier to instruct LaTeX to position the figure (or table) in precisely the same position it occupies in the source code. However, this specifier does not work with wide figures or tables: you should use 'h!' instead, like so: \begin{figure*} [figure*] [n!].

You may have noticed the full width image at the very beginning of this chapter: that, however, is set up in an entirely different way, which you'll read about in Chapter 6 on page 22.

kaobook also supports paginated tables (have a look at the longtable package). The longtable 1 environment1: behaves a bit differently from table, in that longtable encompasses both table and tabular, so that you $^{\text{Incan}}$ can write, e.g.,

```
Listing 4.4::

1 \begin{longtable}{|l c c|}

2 \hline
3 One & Two & Three \\
4 Left & Center & Center \\
5 \hline
6 \caption{Caption of the longtable.}
7 \end{longtable}
```

to obtain the following table:

| One | Two | Three |
|------|--------|--------|
| Left | Center | Center |

 Table 4.4: Caption of the longtable.

The caption of a longtable is always positioned below the table, and it has the same width as the text (it^{set} doesn't extend into the margin). However, sometimes you may need a longtable that is so wide that it correctly. trespass into the margins; in those cases, you may want to also increase the width of the caption. To do so, you'll have to write two additional commands, one before and one after the longtable:

Listing 4.5:: Increasing the width of the cap-

tion

- \floatsetup[longtable]{margins=centering,LTcapwidth=table} % Add this line before the longtable to increase the caption width
- 2 \begin{longtable}{lp{8cm}p{5cm}p{2cm}}

3 ...

- 4 \end{longtable}
- \floatsetup[longtable]{margins=raggedright,LTcapwidth=\textwidth} % Add this line after the longtable to revert the previous change

Having seen figures and tables, it is now time to tackle hyperreferences.

5.1 Citations

To cite someone [1, 2] is very simple: just use the \sidecite command. It does not have an offset argument[1]: yet, but it probably will in the future. This command supports multiple entries, as you can see, and by default vissit prints the reference on the margin as well as adding it to the bibliography at the end of the document. Note that the citations have nothing to do with the text,[2] but they are completely random as they only serve the purpose to illustrate the feature. (2008),

For this setup I wrote a separate package, kaobiblio, which you can find in the styles directory and includein your main tex file. This package accepts all the options that you can pass to biblatex, and actually it tability passes them to biblatex under the hood. Moreover, it also defines some commands, like \sidecite, and in environments that can be used within a kao book.

For this setup I wrote a separate package, kaobiblio, which you can find in the styles directory and includein your main texture in the styles directory and includein your main texture in your main texture in the styles directory and includein your main texture in your main textur

If you want to use bibtex instead of biblatex, pass the option backenter biblex to kaobiblio. kaobiblio supports two options that are not shared with biblatex: addspace and linkeverything, both of which are boolean options, meaning that they can take either 'true' or 'false' as And due. If you pass addspace=true concepts when loading kaobiblio, a space will be automatically added before the citation marks. If you pass and linkeverything=true, the author's name in the authoryear-* and authoryear-* styles will be a hyperlink like contained to the pass. And the pass and authoryear-* and authoryear

As you have seen, the \sidecite command will print a citation in the margin. However, this command [2]: would be useless without a way to customise the format of the citation so the kaobook provides also the lames \formatmargincitation command. By 'renewing' that command, you be tarexhoose which items will be printed in the margins. The best way to understand how it works is the see the actual definition of this (2013), command.

```
\newcommand{\formatmargincitation}[1]{%
   \parencite{#1}: \citeauthor*{#1} (\citeyear{#1}), \citetitle{#1}%
}
```

Thus, the \formatmargincitation accepts one parameter, which is the $\frac{\text{tiph}}{\text{are}}$ in key, and prints the parencite $\frac{to}{Sta}$ followed by a colon, then the author, then the year (in brackets), and finally the title.[3] Now, suppose that tis you wish the margin citation to display the year and the author, followed by the title, and finally a fixed ti arbitrary string; you would add to your document:

```
\renewcommand{\formatmargincitation}[1]{%
   \citeyear{#1}, \citeauthor*{#1}: \citetitle{#1}; very interesting!%
```

The above code results in citations that look like the following. [4] Of course, changing the format is most useful_{al}. when you also change the default bibliography style. For instance, if you want to use the 'philosophy-modern' (2013), style for your bibliography, you might have something like this in the preamble: An In-

```
\usepackage[style=philosophy-modern]{styles/kaobiblio}
\renewcommand{\formatmargincitation}[1]{%
   \sdcite{#1}%
}
\addbibresource{main.bib}
```

The commands like \citeyear , \parencite and \sdcite are just examples. A full reference of the available \cite{cal} commands can be found in this cheatsheet, under the 'Citations' section.

Finally, to compile a document containing citations, you need to use an external tool, which for this class is biber. You need to run the following (assuming that your tex file is called main.tex):

ers

does not

re-

sult

prob-

in

```
$ pdflatex main
                                                                                                    2:
                                                                                                    The
$ biber main
                                                                                                    fact
$ pdflatex main
                                                                                                    that
                                                                                                    the
                                                                                                    au-
5.2 Glossaries and Indices
                                                                                                    thor
```

The kaobook class loads the packages glossaries and imakeidx, with which you can add glossaries andnot indices to your book. For instance, I previously defined some glossary entries and now I am going to use, them, like this: computer. glossaries also allows you to use acronyms, like the following: this is the full $_{\rm per-}^{"}$ version, Frame per Second (FPS), and this is the short one FPS. These entries will appear in the glossary inlink the backmatter. both-

Unless you use Overleaf or some other fancy IDE for LATEX, you need to run an external command from yourmore terminal in order to compile a document with a glossary. In particular, the commands required are:³ one

```
$ pdflatex main
                                                                                                                bibla
                                                                                                                tex
$ makeglossaries main
                                                                                                                user.
$ pdflatex main
                                                                                                                There
```

Note that you need not run makeglossaries every time you compile your document, but only when you are change the glossary entries.

To create an index, you need to insert the command \index{subject} whenever you are talking about 'subject'guin the text. For instance, at the start of this paragraph I would write $index{index}$, and an entry would be e^{ments} added to the Index in the backmatter. Check it out! hy-

per-A nomenclature is just a special kind of index; you can find one at the end of this book. To insert a_{link}^{rc} nomenclature, we use the package nomencl and add the terms with the Prommand \nomenclature. We puting then a \printnomenclature where we want it to appear. au-

Also with this package we need to run an external command to complete the document, otherwise thethor nomenclature will not appear: name. need

```
$ pdflatex main
                                                                                                         in
$ makeindex main.nlo -s nomencl.ist -o main.nls
                                                                                                         my
                                                                                                         per-
$ pdflatex main
```

These packages are all loaded in packages.sty, one of the files that come with this class. However, the opinconfiguration of the elements is best done in the main.tex file, since each book will have different entries and ion, styles. mand

Note that the nomencl package caused problems when the document was compiled, so, to make a long story aushort, I had to prevent scrhack to load the hack-file for nomencl. When compiling the document on Overleaf thor's fl8h however, this problem seem to vanish. name was well,

5.3 Hyperreferences

Together with this class we provide a handy package to help you reference the same elements always in the lems same way, for consistency across the book. First, you can label each element with a specific command. For in instance, should you want to label a chapter, you would put \label{chapter_practitle} right after the \chapter_{practitle} directive. This is just a convenience, because \labch is actually just artifated \label{ch:chapter-title}.iiso it spares you the writing of 'ch:'. We defined similar commands formany typically labeled elements, cal including: file there-

variable se-

lec-

verv

ter-

| • | Page: \labpage |
|---|---------------------|
| • | Part: \labpart |
| • | Chapter: \labch |
| • | Section: \labsec |
| • | Figure: \labfig |
| • | Table: \labtab |
| • | Definition: \labdef |

| ➤ Assumption: \labassum | [3]: |

| Exercise. (tubexer crise | ter- |
| | |

Of course, we have similar commands for referencing those elements. However, since the style of the reference the should depend on the context, we provide different commands to reference the same thing. For instance, ingesome occasions you may want to reference the chapter by name, but other times you want to reference it onlynetic by number. In general, there are four reference style, which we call plain, vario, name, and full.

The plain style references only by number. It is accessed, for chapters, with \refch{chapter-title} (for other of elements, the syntax is analogous). Such a reference results in: Chapter 5.

The vario and name styles rest upon the varioref package. Their syntax is $\rcent{chapter-title}$ and \rcent{diag} nrefch{chapter-title}, and they result in: Chapter 5 on page 17, for the vario style, and: Chapter 5 (References) \rcent{ver} for the name style. As you can see, the page is referenced in varioref style.

The full style references everything. You can use it with $frefch{chapter-title}$ and it looks like this: Chapter frequences equencing 5 (References) on page 17.

Of course, all the other elements have similar commands (*e.g.* for parts you would use \vrefpart{part-title}922 or something like that). However, not all elements implement all the four styles. The commands provided inshould be enough, but if you want to see what is available or to add the missing ones, have a look at the diattached package.

In order to have access to all these features, the kaorefs should be loaded in the preamble of your document '2005. It should be loaded last, or at least after babel (or polyglossia) and plaintheorems (or mdftheorems) Zou Options can be passed to it like to any other package; in particular, it is possible to specify the language of theet captions. For instance, if you specify 'italian' as an option, instead of 'Chapter' it will be printed 'Capitolo', Reg the Italian analog. If you know other languages, you are welcome to contribute the translations of these captions! Feel free to contact the author of the class for further details.

The kaorefs package also include cleveref, so it is possible to use \cref{tin} addition to all the previously \cref{tin} described referencing commands.

5.4 A Final Note on Compilation

```
1 | latexmk [latexmk_options] [filename ...]
```

latexmk can be extensively configured (see https://mg.readthedocs.io/latexmk.html). For convenience, steps in the print here an example configuration that would cover all the steps described above.

```
# By default compile only the file called 'main.tex'

@default_files = ('main.tex');

# Compile the glossary and acronyms list (package 'glossaries')

                                                                                                                   sys-
20
                                                                                                                   tem.
```

However, if you'd rather not use an external package and want to do everything manually, here are some see tips. 4 also

Compiling the examples in the kaobook repository

To compile the examples, and in particular the documentation, that are in the examples directory of the $^{(A)}$ kaobook repository on GitHub, do as follows. cd into the root directory of the repository, and run pdflatex Fi nal -output-directory examples/documentation main.tex. With this trick, you can compile the documentation Note using the class files pertaining to the repository (and not, say, those in your texmf tree). The '-output-directory' on option works with the other LATEX-related commands such as biber and makeglossaries.

A note of warning: sometimes LATEX needs more than one run to get the correct position of each element; this lais true in particular for the positioning of floating elements like figures, tables, and margin notes. Occasionally, LATEX can need up to four re-runs, so If the alignment of margin elements looks odd, or if they bleed into ther have main text, try runnign pdflatex one more time.

Design and Additional Features

author only uses Linux and compiles everything from the command line, he doesn't know how the compilation works in Windows or Mac. The tips, therefore, refer to the usage with Linux fromthe command line.

4: As the

6.1 Headings

honest, I do not think

So far, in this document I used two different styles for the chapter headings: one has the chapter name, a rulemix-and, in the margin, the chapter number; the other has an image at the top of the page, and the chapter title ising printed in a box (like for this chapter). There is one additional style, which I used only in the Chapter 7.3 heading (Appendix); there, the chapter title is enclosed in two horizontal rules, and the chapter number (or letter, in styles the case of the appendix) is above it. like this

Every book is unique, so it makes sense to have different styles from which to choose. Actually, it would be is awesome if whenever a kao-user designs a new heading style, he or she added it to the three styles already present, so that it will be available for new users and new books.

Wise choice,

The choice of the style is made simple by the \setchapterstyle command. It accepts one option, the name^{but} of the style, which can be: 'plain', 'kao', 'bar', or 'lines'.² If instead you want the image style, you have to use in the command \setchapterimage, which accepts the path to the image as argument; you can also provide and optional parameter in square brackets to specify the height of the image. \setchapterimage automatically sets the chapter style to 'bar' for that chapter (and also for subsequent chapters).

Let us make some examples. In this book, I begin a normal chapter with the lines:

1 \setchapterstyle{kao}
2 \setchapterpreamble[u]{\margintoc}
3 \chapter{Title of the Chapter}
4 \labch{title}

In Line 1 I choose the style for the title to be 'kao'. Then, I specify that I want the margin toc. The rest look is ordinary administration in LATEX, except that I use my own \label to label the chapter. Actually, the 2: \setchapterpreamble is a standard KOMA-Script one, so I invite you to read about it in the KOMAPlain documentation. Once the chapter style is set, it holds until you change it. Whenever I want to start a chapter with an image, I simply write:

1 \setchapterimage[7cm]{path/to/image.png} % Optionally specify the height

\setchapterpreamble[u]{\margintoc}

3 \chapter{Catchy Title} % No need to set a chapter style

4 \labch{catchy}

tle style;

fault

LATEX

ti-

did it

are self explanatory.

6.2 Headers & Footers

The \margintoc

3:

ery chap-

ter. Per-

haps

this may change;

me

vou

have preferences!

if

in the future

Headers and footers in KOMA-Script are handled by the scrlayer-scrpage package. There are two basichas style: 'scrheadings' and 'plain.scrheadings'. The former is used for normal pages, whereas the latter is used into title pages (those where a new chapter starts, for instance) and, at least in this book, in the front matter. At any rate, the style can be changed with the \pagestyle command, e.g. \pagestyle {plain.scrheadings}.

In both styles, the footer is completely empty. In plain.scrheadings, also the header is absent (otherwise it at wouldn't be so plain...), but in the normal style the design is reminiscent of the 'kao' style for chapter titles.

To Do

The twoside class option is still unstable and may lead to unexpected behaviours. As always, any help will be greatly appreciated.

6.3 Table of Contents

Another important part of a book is the table of contents. By default, in kaobook there is an entry for everything: list of figures, list of tables, bibliographies, and even the table of contents itself. Not everybody all might like this, so we will provide a description of the changes you need to do in order to enable or disable each of these entries. In the following Table 6.1, each item corresponds to a possible entry in the TOC, and itso description is the command you need to provide to have such entry. These commands are specified in the this attached style package, 4 so if you don't want the entries, just comment the corresponding lines.

Of course, some packages, like those for glossaries and indices, will try to add their own entries. In $such_{will}^{ture}$ cases, you have to follow the instructions specific to that package. Here, since we have talked about glossaries be and notations in Chapter 5, we will briefly see how to configure them.

For the glossaries package, use the 'toc' option when you load it: \usepackage[toc]{glossaries}. Forby nomencl, pass the 'intoc' option at the moment of loading the package. Both glossaries and nomencl are the loaded in the attached 'packages' package.

Additional configuration of the table of contents can be performed through the packages etoc, which keep is loaded because it is needed for the margintocs, or the more traditional tocbase. Read the respective touch documentations if you want to be able to change the default TOC style. (And

Table 6.1: Commands to add a particular entry to the table of contents.

6.4 Paper Size

Recent versions of Kaobook support paper sizes different from the defau**TeMer**. It is possible to pass the name_{same} of the paper as an option to the class, as we are accustomed for any other non-text class. For example, the classfile, option b5paper would set the paper size to the B5 format.

We also support the paper sizes specified in this web page and some additional sizes requested by the users, also with the option names specified in Table 6.2.

For instance, to use the 'smallpocketpaper' add the correct description at the beginning of the document class tiles instruction:

6.5 Page Layout

17.0cm x 17.0cm smallphotopapersee 21.0cm x 15.0cm appendixpapersee 17.0cm x 22.0cm cookpaper how 19.0cm x 27.0cm illustratedpaperou

Besides the page style, you can also change the width of the content of a page. This is particularly useful for depages dedicated to part titles, where having the 1.5-column layout might be a little awkward, or for pages your where you only put figures, where it is important to exploit all the available space.

In practice, there are two layouts: 'wide' and 'margin'. The former suppresses the margins and allocates the ing full page for contents, while the latter is the layout used in most of the pages of this book, including this one entre wide layout is also used automatically in the front and back matters.

To change page layout, use the \pagelayout command. For example, when I start a new part, I write:

```
1 \pagelayout{wide}
2 \addpart{Title of the New Part}
3 \pagelayout{margin}
```

Beyond these two basic layouts, it is also possible to finely tune the page layout by redefining the an \marginlayout command. This command is called internally by the higher-level \pagelayout, and it try is responsible for setting the width of the margins and of the text. The default definition is:

```
\newcommand{\marginlayout}{%
2
       \newgeometry{
                                    % height of the top margin
3
           top=27.4mm.
                                    % height of the bottom margin
           bottom=27.4mm,
           inner=24.8mm,
                                    % width of the inner margin
6
           textwidth=107mm,
                                    % width of the text
7
           marginparsep=8.2mm,
                                    % width between text and margin
8
           marginparwidth=49.4mm,
                                   % width of the margin
9
      }%
10
```

so if you want to, say, decrease the width of the margin while increasing the width of the text, you could write in the preamble of your document something like:

```
textwidth=117mm.
                                     % width of the text
6
                                                                                                             Sometimes
7
           marginparsep=8.2mm,
                                    % width between text and margin
                                                                                                             is
8
           marginparwidth=39.4mm, % width of the margin
                                                                                                             de-
9
       }%
                                                                                                             sir-
10 }
                                                                                                             able
                                                                                                             to
  where the text width has been increased by 10mm and the margin width has been decreased by 10mm.
                                                                                                             in-
                                                                                                             crease
                                                                                                             width
  6.6 Numbers & Counters
                                                                                                             for
                                                                                                             just
  In this short section we shall see how dispositions, sidenotes and figures are numbered in the kaobook one
  class.
  By default, dispositions are numbered up to the section in kaobook and up to the subsection in kaohandt para-
  This can be changed by passing the option secnumdepth tokaobook or kaohandt (e.g. 1 corresponds to section graphs;
  and 2 corresponds to subsections).
                                                                                                             widepar
  The sidenotes counter is the same across all the document, but if you want it to reset at each chapter, justen-
  uncomment the line
                                                                                                             ron-
  \counterwithin*{sidenote}{chapter}
                                                                                                             ment
                                                                                                             does
  in the styles/style.sty package provided by this class.
                                                                                                             that:
  Figure and Table numbering is also per-chapter; to change that, use something like:
                                                                                                             your
                                                                                                             para-
  \renewcommand{\thefigure}{\arabic{section}.\arabic{figure}}
                                                                                                             graphs
                                                                                                             in
                                                                                                             this
  6.7 White Space
                                                                                                             en-
                                                                                                             ron-
  One of the things that I find most hard in LATEX is to finely tune the white space around objects. There are ment,
  not fixed rules, each object needs its own adjustment. Here we shall see how some spaces are defined at the and
  moment in this class.
                                                                                                             will
                                                                                                             oc-
  Space around sidenotes and citations marks
                                                                                                             cupy
                                                                                                             the
  There should be no space before or after sidenotes and citation marks, like so:
                                                                                                             full
                                                                                                             width
  sidenote<sup>6</sup>sidenote
                                                                                                             of

Mathematics and Boxes

7.1 Theorems

Despite most people complain at the sight of a book full of equations, mathematics is an important part of $_{\mathrm{nose}}^{\mathrm{ag-}}$ many books. Here, we shall illustrate some of the possibilities. We believe that theorems, definitions, remarks_{any} and examples should be emphasised with a shaded background; however, the colour should not be to heavyproblems: on the eyes, so we have chosen a sort of light yellow.¹ if

Definition 7.1.1 Let (X, d) be a metric space. A subset $U \subset X$ is an open set if, for any $x \in U$ there exists r > 0such that $B(x,r) \subset U$. We call the topology associated to d the set τ_d of all the open subsets of (X,d).

Definition 7.1.1 is very important. I am not joking, but I have inserted this phrase only to show how tosidenotes reference definitions. The following statement is repeated over and over in different environments. or

Theorem 7.1.1 A finite intersection of open sets of (X, d) is an open set of (X, d), i.e τ_d is closed under finite intersections. Any union of open sets of (X, d) is an open set of (X, d).

Proposition 7.1.2 A finite intersection of open sets of (X, d) is an open set of (X, d), i.e τ_d is closed under finite intersections. Any union of open sets of (X, d) is an open set of (X, d).

Lemma 7.1.3 A finite intersection^a of open sets of (X, d) is an open set of (X, d), i.e τ_d is closed under finite intersections. Any union of open sets of (X, d) is an open set of (X, d).

a I'm a footnote

You can safely ignore the content of the theorems... I assume that if you are interested in having theorems in $\frac{1}{100}$ your book, you already know something about the classical way to add them. These example should just defishowcase all the things you can do within this class. ni-

Corollary 7.1.4 (Finite Intersection, Countable Union) A finite intersection of open sets of (X, d) is an open set of (X, d), i.e τ_d is closed under finite intersections. Any union of open sets of (X, d) is an open set of (X, d).

Proof. The proof is left to the reader as a trivial exercise. Hint: Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

Definition 7.1.2 Let (X, d) be a metric space. A subset $U \subset X$ is an open set if, for any $x \in U$ there exists r > 0such that $B(x,r) \subset U$. We call the topology associated to d the set τ_d of all the open subsets of (X,d).

Example 7.1.1 Let (X, d) be a metric space. A subset $U \subset X$ is an open set if, for any $x \in U$ there exists r > 0 such that $B(x, r) \subset U$. We call the topology associated to d the set τ_d of all the open subsets of (X, d).

Remark 7.1.1 Let (X, d) be a metric space. A subset $U \subset X$ is an open set if, for any $x \in U$ there exists r > 0 such that $B(x, r) \subset U$. We call the topology associated to d the set τ_d of all the open subsets of (X, d). boxes

As you may have noticed, definitions, example and remarks have independent counters; theorems, proposi-all of tions, lemmas and corollaries share the same counter.

Remark 7.1.2 Here is how an integral looks like inline: $\int_a^b x^2 dx$, and here is the same integral displayed in here, its own paragraph:

$$\int_{a}^{b} x^{2} dx$$

There is also an environment for exercises.

Exercise 7.1.1 Prove (or disprove) the Riemann hypothesis.

We provide one package for the theorem styles: kaotheorems.sty, to which you can pass the framed option you, to do want coloured boxes around theorems, like in this document.² You may want to edit this files according to like your taste and the general style of the book. However, there is an option to customise the background colour of Harlequin. the boxes if you use the framed option: when you load this package, you can pass it the background=mycolouryou option (replace 'mycolour' with the actual colour, for instance, 'red!35!white'). This will change the colour of can all the boxes, but it is also possible to override the default colour only for some elements. For instance, the even propositionbackground=mycolour option will change the colour for propositions only. There are similar sert options for theorem, definition, lemma, corollary, remark, and example.

7.2 Boxes & Custom Environments ³

Say you want to insert a special section, an optional content or just something you want to emphasise. Werem think that nothing works better than a box in these cases. We used md framed to construct the ones shownenbelow. You can create and modify such environments by editing the provided file environments.sty. ron-

7.3 Experiments

It is possible to wrap marginnotes inside boxes, too. Audacious reade tite encouraged to try their ownranexperiments and let me know the outcomes.

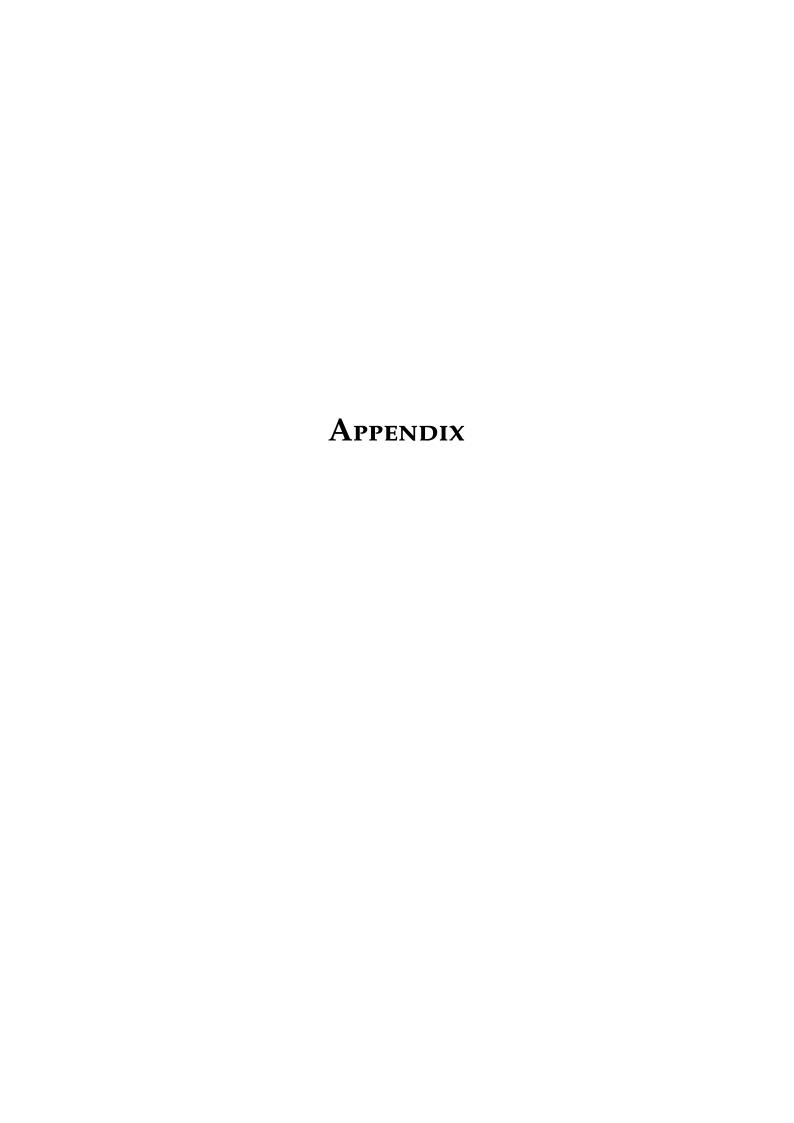

mar-

I believe that many other special things are possible with the kaobookselass. During its development, Ition, struggled to keep it as flexible as possible, so that new features could be acted without too great an effort just Therefore, I hope that you can find the optimal way to express yourselves in writing a book, report or thesis cause with this class, and I am eager to see the outcomes of any experiment that you may try. we

> side a kaobox. (Actually, kaobox side a marginnote!)

can: $x = a_0 +$

2: The styles without framed are not showed, but actually the only difference is that they don't have the yellow boxes.

Heading on Level 0 (chapter)

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

A.1 Heading on Level 1 (section)

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

A.1.1 Heading on Level 2 (subsection)

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A.2 Lists

A.2.1 Example for list (itemize)

- ► First item in a list
- ► Second item in a list
- ► Third item in a list
- ► Fourth item in a list
- ► Fifth item in a list

Example for list (4*itemize)

- ► First item in a list
 - First item in a list
 - * First item in a list
 - · First item in a list
 - · Second item in a list
 - * Second item in a list
 - Second item in a list
- ► Second item in a list

A.2.2 Example for list (enumerate)

- 1. First item in a list
- 2. Second item in a list
- 3. Third item in a list
- 4. Fourth item in a list
- 5. Fifth item in a list

Example for list (4*enumerate)

- 1. First item in a list
 - a) First item in a list
 - i. First item in a list
 - A. First item in a list
 - B. Second item in a list
 - ii. Second item in a list
 - b) Second item in a list
- 2. Second item in a list

A.2.3 Example for list (description)

First item in a list Second item in a list Third item in a list Fourth item in a list Fifth item in a list

Example for list (4*description)
